RL J. Immunol. 163:553-557(1999).

CC -I- FUNCTION: Seems to plays a role in epithelial tight junction

CC formation. Appears early in primordial forms of cell junctions and

recruits PARD3. The association of the PARD5-PARD3 complex may

prevent the interaction of PARD3 with JAM1, thereby preventing

CC right junction assembly (By similarity). Plays a role in

regulating monocyte transmigration involved in integrity of

epithelial barrier. Involved in platelet activation.

CC SUBUNIT: Interacts with the first PDZ domain of PARD3. The

association between PARD3 and PARD6B probably disrupts this

interaction (By similarity).

CC -- SUBCELLUIGAR LOCATION: Type I membrane protein (Potential).

CC -- TISSUE SPECIFICITY: Localized at tight junctions of both

epithelial and endothelial cells.

CC -- SIMILARITY: Contains 2 immunoglobulin-like V-type domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This SWISS-PROT entry is copyright. Isold=P34082-3; Sequence=VSP_002506, VSP_002507;
IISSUE SPECIFICITY: In embryos, both isoforms are initially
expressed on the surface of the axons in the MPI pathway and later
on several other longitudinal axon fascicles.
SIMILARITY: Contains 5 immunoglobulin-like C2-type domains.
SIMILARITY: Contains 2 fibronectin type III domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      STRAIN=Oregon_R,

The wurine CAR homologue (mCAR) is a receptor for coxsackie B viruses and adenoviruses.";
Submitted (MAY-1997) to the EMBL/GenBank/DDBJ databases.
--- SUBCELLUJAR LOCATION: Type I membrane protein.
--- SIMILARITY: Contains 2 immunoglobulin-like C2-type domains.

Submitted (APR-2002) to the EMBL/GenBank/DDBJ databases.
Submitted (APR-2002) to the EMBL/GenBank/DDBJ databases.

-!-PUNCTION: Structural component of the muscle M-line. Myofilament lattice assembly begins with positional cues laid down in the basement membrane and muscle cell membrane. UNC-89 responds to these signals, localizes, and then participates in assembling an M-line.

--- TISSUE SPECIFICITY: Localizes to the middle of A-bands.

--- SIMILARITY: Contains 1 DBL-homology (DH) domain.

--- SIMILARITY: Contains 1 pH domain.

--- SIMILARITY: Contains 1 PH domain.

--- SIMILARITY: Contains 1 PH domain.

--- SIMILARITY: Contains 1 SH3 domains.

  This sequence represents a secreted human protein encoded by the gene clone detailed in the descriptor line. The gene can be used to generate clone detailed in the descriptor line. The gene can be used to generate busion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. AAV34277) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 28 novel genes and their fragments (nucleic acid sequences: AAV3286-V3435; amino acid sequences AAW75196-W75335) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polypucleotides. Specific uses are described for each of the 28 polymucleotides. based on which tissues they are most highly expressed in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                180

Human gene 25 encoded secreted protein HTEEB42, SEQ ID NO:76.

13-DEC-2002 (first entry)

```
AAD44616-AAD44676 represent cDNAs corresponding to 28 human secreted protein genes, and AAE26959-AAE26999 represent the proteins they encode. AAE27000-AAE27025 represent human secreted protein fragments or their variants. The secreted proteins and genes are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Specific uses are described for each of the 28 genes, based on the tissues in which they are most highly expressed and include developing products for the diagnosis or treatment of immunodeficiencies, e.g., X-linked agammaglobulinaemia, B cell immunodeficiencies, severe combined immunodeficiencies, autoimmune disorders e.g., systemic lupus erythematosus, rheumatoid arthritis, multiple sclerosis, autoimmune themolytic anaemia, Goodpasture's syndrome, thyroiditis, autoimmune haemolytic anaemia, Goodpasture's syndrome, Grave's disease, diabetes mellitus, dermatitis, inflammatory conditions
Human; immunodeficiency; X-linked agammaglobulinaemia; septic shock; autoimmune disorder; rheumatoid arthritis; multiple sclerosis; cancer; Grave's disease; diabetes mellitus; hematopoietic disorder; stroke; respiratory disorder; asthma; allergy; gastrointestinal disorder; inflammatory bowel disease; halvergenerative disorder; hepatitis; parknon's disease, Alzheimer's disease; cardiovascular disorder; atherosclerosis; myocarditis; renal disorder; fungicide; virucide; hyperproliferative disorder; acute glomerulonephritis; tonsilitis; respiratory disorder; hinitis; sinusitis; neurological disease; endometriosis; vasotropic; valnerary; cytostatic; nootropic; cardiant; anti-HIV; tranquilliser; gout; antiparasitic.

New nucleic acid molecules encoding 28 human secreted proteins, useful for diagnosing, preventing, treating or ameliorating medical conditions and as food additives or preservatives

Claim 11; Page 186-187; 209pp; English.

AAD44854-AAD44984 represent CDNAs corresponding to 28 human secreted protein genes, and AAE27097-AAE27137 represent the proteins they encode. AAE27184 represent human secreted protein fragments. The genes and their corresponding secreted proteins are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Secreted protein sequences of the invention are useful for the cliagnosis or treatment of disorders such as autoimmune diseases (e.g. cherapy. Secreted protein sequences of the invention are useful for the disorders or liver), cerebrovascular disorders (e.g. cerebral ischaemia, angiogenesis), cardiovascular disorders (e.g. cardiac arrest), nervous system disorders (e.g. Alzheimer's disease), infections caused by fungi, bacteria and viruses and ocular disorders (e.g. corneal infection). The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sumburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, correspondent inpid, protein, carbohydrate, vitamins, minerals, coffectors and other nutritional components. They can also be used as food additives or preservative to increase or decrease storage capabilities, and other nutritional components. The present sequence represents a human and a protein, et al. secreted protein of the invention.

(ABR47633-ABR48145) and their coding sequences (ACC50344-ACC50856). The
proteins and their coding sequences are useful for the preparation of a
diagnostic or pharmaceutical composition for diagnosing or treating a
cardiovascular disorder (e.g., arrhythmia, tachycardia, cardiac arrest,
cardiovascular disorders, muscular disorders, reproductive disorders,
immune system disorders, pulmonary disorders, reproductive disorders,
c gastrointestinal disorders, pulmonary disorders, renal disorders,
c proliferative disorders and/or cancerous diseases and conditions, for
c wound healing and epithelial call proliferation, to treat inflammation or
c infection, for treating thrombosis and arteriosclerosis, for treating or
c preventing neural damage which occurs in neuronal disorders or
neurodegenerative conditions such as Alzheimer's disease and Parkinson's
c neurodegenerative or conditions such as Alzheimer's disease and parkinson's
c disease, to enhance bone and periodontal respeneration and aid in tissue
c transplants or bone grafts, to prevent skin aging or hair loss, to
stimulate growth and differentiation of haematopoietic cells and bone
marrow cells when used in combination with other cytokines, to maintain
                                                                                                                                    180

```
The invention relates to an isolated polypeptide comprising an amino acid grequence at least 95% identical to sequence of 28 human secreted form, protectins, their fragment, polypeptide domain epitope, secreted form, concluded are the encoded sequence included in Arc 97921 and 97922. Also included are the encoding mucleic acids, recombinant vectors, host cells, antibodies, and genes. CT he proteins and mucleic acids are useful for diagnosing, preventing, concluded in Arc 67921 ameliorating a medical condition e.g. immunodeficiencies, severe combined immunodeficiencies, severe combined immunodeficiencies, autoimmune immunodeficiencies, severe combined immunodeficiencies, autoimmune characteries, autoimmune haemolytic anaemia, disorders (as orders, inflammatory bowel lases, crohn's disease), celerosis autoimmune haemolytic anaemia, demartitis, respiratory disorders (e.g. gastric, ovarian, lung, bladder, liver and breakling indivory, inflammatory bowel disease, crohn's disease), crespiratory disorders (e.g. gastric, ovarian, lung, bladder, liver and breakling and prinn disease), cancers (e.g. gastric, ovarian, lung, bladder, liver and breakling and prinn disease, and largy), gastrointestinal confusion injury, nother and breakling and prinn disease, cancers (e.g. parkinson's disease and Alzheimer's disease, AlDS-related disorders (misorders (e.g. parkinson's disease and Alzheimer's disease, AlDS-related charentia, and prinn disease), cardiovascular disease, and cardiopulmonary pancreatities, mycorders (thrombosis, arterial thrombosis, acterial thrombosis, cardiovascular disease, and cardiopulmonary pancreatities, sarcoidosis, dermatitia, allogenic transplant rejection), hyperpitierations, inflammation (e.g. hepetities) and cardiopulmonary complement adisorders (e.g. endometries) and disorders (e.g. endometries) are also useful to enhance or inhibit comp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New human secreted polypeptides and polynucleotides for diagnosing, prognosing, preventing and treating immune, hyperproliferative, liver, kidney, reproductive disorders and for identifying modulators of

       ABZ71190-ABZ71478 represent CDNAs corresponding to 178 human secreted

Drotein genes, and ABP00011-ABP00299 represent the proteins they encode.

ABZ71479-ABZ714740 represent human secreted protein genomic fragments. The
invention also encompasses antibodies specific for the secreted proteins,
the use of the secreted proteins in drug screening, and recombinant

Consider and host cells comprising a nucleic acid of the invention. The
secreted proteins, nucleic acids encoding them, antibodies or antibody
fragments specific for the secreted proteins, and modulators of protein

Consephagus, stomach, small intestine, large intestine, liver, biliary
coesophagus, stomach, small intestine, large intestine, liver, biliary
tract and pancreas, and include cancers of these organs and tissues. The
coesophagus and their nucleic acids may also be used in the
treatment of immune disorders, inflammation, inflection,
hyperproliferative disorders, and to promote wound healing. Nucleic acids

Contract invention may be used for chromosome identification, chromosome
mapping, in gene therapy, for identifying individuals from minute

Consequence in arkein sequence represents a human secreted protein of the

                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a secreted protein. The polynucleotide would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating activity, tissue avaccinas) or suppressing activity, hematopolesis regulating activity, tissue growth activity, activin/inhibin activity, chematopolesis receptor/ligand activity, auti-inflammatory activity, catherin/tumour invasion suppressor activity, anti-inflammatory activity, catherin/tumour invasion suppressor activity, anti-inflammatory activity, catherin/tumour given in the specification to support these activities). The polynucleotide is also stated to be useful for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    118
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        298

The polynuclectide encoding the polypeptide is useful for recombinant production of JAM-2 protein, which in turn is useful for recombinant of antibodies. The antibodies may be used for probing cellular localisation and/or expression of JAM2 in tissues under normal and disease states, for immunopracipitating JAM2 in cissues to determine whether it is modified by glycosylation and phosphorylation, and for determining JAM2 function. The antibodies inhibit interaction of JAM2 with inflammatory cells or influences their paracellular migration, and is therefore useful for alleviating inflammatory diseases such as arthritis, asthma, rheumatory diseases such as arthritis, asthma, rheumatorid arthritis, inflammatory bowel disease and Crohn's disease.
                                                                                                                                                                                                                                                                                      The sequence represents a human junctional adhesion molecule 2 (JAM2).
                                                                                                                                                                                                                                        Novel nucleic acids encoding human junctional adhesion protein useful for producing antibodies that are suitable for therapeutic purposes

ઠ g ò g ò g

The invention relates to human secreted or transmembrane protein (1), their fragments and is encoded by specific complementary deoxyribonucleic caid (CDNA) inserts (II), where the protein is substantially free from cother mammalian proteins. (I) are useful for preventing, treating or other mammalian proteins. (I) are useful for preventing, treatment or meablorating a medical condition, cell differentiation, antiinflammatory, cytokine, cell proliferation, cell differentiation, antiinflammatory, cytokine, cell proliferation, cell differentiation, antiinflammatory, cytokine, cell proliferation, cell differentiation, antiinflammatory, cytokine. (I) can be used to manipulate stem cells in culture to give crise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, autoimment disease, accidental damage or cells damaged by illness, autoimment disease, accidental damage or cells damaged by illness, the proliferation of neural cells and central and peripheral nervous system diseases and neuropathies, such as Alzheimer's, Parkinson's disease, Muntington's disease, amyotrophic central aclerosis. (I) is involved in chemotactic or chemokinetic activity, regulation of haematopoiesis and is useful for treating myeloid or lymphoid cell disease, platelet disorders such as thrombocytopaenia cor lymphoid cell disorders, platelet disorders such as thrombocytopaenia cor lymphoid cell disorders, platelet disorders such as thrombocytopaenia cor lymphoid cell disorders, platelet disorders such as thrombocytopaenia cor lymphoid sepenatation of bone, cartilage, tendon, ligament and/or nerve corpusions in tissue repeair, healing of burns, incissions, ulcers, for treating osteoporosis, osteoarthritis, bone degeneration or cegeneration and treatment of lung or liver in verient lissues, various immune deficiencies and disorders including auctoinmune disorders e.g. multiple sclerosis, rheumatoid arthritis,

diabetes mellitus, myasthenia gravis, allergic reactions and conditions, such as asthma or other respiratory problems. (II) is useful to express recombinant protein, as markers for tissues in which the corresponding protein is preferentially expressed and in gene therapy. The present sequence is that of a polypeptide of the invention.

                                                                                          The invention comprises the DNA and protein sequences of the extracellular region of human junctional adhesion molecules (huJAM). The extracellular huJAM DNA and protein sequences are useful in the treatment of: immune system disorders (e.g. immune deficiency); autoimmune disorders; inflammatory disorders; cancer; wound healing; or a cardiovascular disease. The present amino acid sequence represents the full-length membrane-bound huJAMZ protein.
                                                                                                                                                                                                                                                                                                                                                                                                                              118
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       178

carrier or excipient), a novel processor containing (appart from a carrier or excipient), a novel processor containing (appart from a carrier or excipient), a novel processor of infiltration of infiltration of infiltration. The composition increase or decreases any of the effects (inflammatory cells into tissue; (ii) an immune response; or (ii) To proliferation. The composition increases or decreases any of the effects (inflammatory cells include their fragments, are used to treat immune-related diseases, and their fragments, are used to treat immune-related diseases.

CC and their fragments, are used to treat immune-related diseases, particularly T cell-mediated diseases. The diseases treated include systemic spondyloarthropathies, systemic sclerosis (scleroderma), inflammatory myopathies (stematomyositis, polympositis), dispathic inflammatory myopathies (stematomyositis, polympositis), dispathic inflammatory myopathies, systemic vasculitis, sarcoidosis, autoimmune thrombocytopenia, indipathic inflammatory myopathies (dermatomyositis, polympositis), hemoglobinuria), autoimmune thrombocytopenia, indipathic antematical thrombocytopenia, indipathic antematical thrombocytopenia, indipathic antematical thrombocytopenia, indipathic antematory demyelinating polymeuropathy, inflectious hepatitis active hepatitis, tubulointersitial mediated renal disease, clinflammatory demyelinating polymeuropathy, inflectious hepatitis, and sclerosing cholangitis, inflammatory bowel diseases including chaptains of molangitis, inflammatory bowel diseases including chaptains and sclerosing cholangitis, inflammatory bowel diseases including chaptains and sclerosing cholangitis, inflammatory bowel diseases. Culcerative colitis; atopic dermatitis, and sclerosing cholangitis, inflammatory demyelinating polymeuropathy, inflammatory demyelinating polymeuropathy, inflammatory demyelinating polymeuropathy, inflammatory demyelinating polymeuropathy, inflammatory demyelinating polymeuropathy.

Culcerative colitis; crohn's disease, erythema multi
                                                                                                                                                                                                                                                                                            This invention describes a novel composition containing (apart from a

The specification describes A33 related antigens PR0301, PR0362 and PR0245. The methods and compositions of the invention are useful for the treatment and diagnosis of inflammatory disease and tumours in mammals. Such inflammatory diseases include of inflammatory bowel disease, systemic slerosis, soleroderma, clupus erythematosis, rheumatoid arthritis, juvenile chronic arthritis, spondyloarthropathies, systemic selerosis, soleroderma, cliopathic inflammatory myopathies, systemic selerosis, soleroderma, cliopathic inflammatory myopathies, systemic selerosis, autoimmune hemolytic slogren's syndrome, systemic vaculitis, sarcoidosis, autoimmune hemolytic canemia, immune pancytopenia, paroxysmal nocturnal hemoglobinuria, autoimmune thrombocytopenia, thyroiditis, Grave's disease, autoimmune thrombocytopenia, thyroiditis, Grave's disease, cleania, immune pancytopenia, lidopathic thyroiditis, atrophic thyroiditis, diabetes mellitus, immune-mediated thrombocytopenia, lymphocytic thyroiditis, atrophic thyroiditis, diabetes mellitus, immune-mediated sensitiis, inflammatory solicitis, inflammatory solicitis, incommune chronic active cliopathic polyneuropathy, hepatobiliary diseases, infectious hepatitis, octive cholangitis, inflammatory and fibrotic lung diseases, alteria, esensitive enteropathy, Whipple's disease, autoimmune chronic active cholangitis, inflammatory and fibrotic lung diseases allergic diseases of the lung such as eosinophilic pneumonias, idiopathic pulmonary fibrosis and hypersensitivity pneumonitis
cransplantation associated disease disease. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               59 SRLEWKKLGRSVSFVYYQQTLQGDFKNRAEMIDFNIRIKNVTRSDAGKYRCEVSAPSEQG 118

AAY13344-403 represent secreted and transmembrane human proteins.

The cDNA sequences are obtained from cDNA libraries, prepared from

CC fetal lung, fetal lidner, fetal brain,

CT the encoded polypeptides have specific uses based on their retina.

The encoded polypeptides have specific uses based on their homology to

Known polypeptides, e.g. PRO211 and PRO217 can be used for disorders

CC known polypeptides, e.g. PRO211 and intenance of gastrointestinal

CC with the preservation and maintenance of gastrointestinal

CC uterration and congenital microvillus atrophy, skin diseases associated

With abnormal keratinocyte differentiation (e.g. psoriasis, epithelial

CC uterration and congenital microvillus atrophy, skin diseases associated

With abnormal keratinocyte differentiation (e.g. psoriasis, epithelial

CC ptent effects on cell growth and development, diseases related to

CC growth or survival of nerve cells including Parkinson's disease,

CC growth or survival of nerve cells including Parkinson's disease,

CC for fibromodulin, e.g. for reducing dermal scarring. PRO266 can be used as a

CC usher Syndrome or Atrophia areats; PRO533 may be used in the treatment

CC uther Lumombotic agent; PRO287 polypeptides and portions may have

CC therefore a papications in wound healing and tissue repair; PRO317 can

CC be used for treating problems of the kidney, uterus, endometrium, blood

Verseels, or related tissue, e.g. in the heart of genital tract.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SRLEWKKLGRSVSFVYYQQTLQGDFKNRAEMIDFNIRIKNVTRSDAGKYRCEVSAPSEQG 118

The present invention describes sixty four human PRO proteins which can be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO antibodies, agonists and antagonists are useful for proteins, anti-PRO antibodies, agonists and antagonists are useful for treating and disagnosing immune related disorders. The disorders are selected from systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathies, systemic sclerosis, idiopathic inflammatory myopathies, Sjogren's systemic vasculitis, aarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases, inflammatory bowel disease, gluten-sensitive enteropathy and Whipple's disease, autoimmune or immune-mediated skin disease, allergic diseases, immunological diseases of the lung, and transplantation associated diseases including graft rejection and graft-versus-host-disease. AACS8379 to AACS879 represent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AACS879 to AACS842 and sequences given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

useful for preventing, diagnosing and treating diagnosing a cardiovascular, endothelial or angiogenic disorder in mammals by modulating cell proliferation, angiogenesis and cardiovascularisation, and for identifying agonists and antagonists of these processes. The nucleic acids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate PRO expression such as cardiovascular, endothelial or angiogenic disorders in mammals (e.g. atherosclerosis, cancers and containing them and the PRO polypeptide may be used to treat disorders associated with decreased PRO expression. AAA77510 to AAA77721 and AAB2438E to AAB24435 represent nucleotide and protein sequences used in
                                                                                                                                                                                                                                                                                                                                                                          Gerber H, Hillan KJ, Goddard A;
